

11.1 Test Risks / Issue:

Transaction functionality of ~~registration~~ customer registration can be occurred for that reason safety issues in the system will be alert. Additionally, complex functions can shown in to the system. If those problem created then the problems will be located and sends them to developers.

11.2. Item to be tested on / not tested.

Item to test	Test description	Test Date	Responsibility
Customer Registration	Check all features of registration criteria with a demo value. If it is successful then save it in database and show login page. If not successful then inform user and keep the registration page	22.6.22	Developer

11.3 Test approach(s)

customer registration: During the testing approach of customer registration a developer recheck all functionality design that UI/UX designer provided then check all overview of this page is working properly yes or not if any problem occurs then try to solve that problem.

11.4. Test regularity / Mandate criteria

Before release and given to the client this feature must have to recheck that the whole process worked completely. The regulations like customer registration should be appropriate with the need information. There have some

mandatory criteria like customer must have an unique and valid password like there will be uppercase with the symbol mixed in the password field.

40.5. Test pass / fail criteria.

In ~~customer~~ customer registration there must have all field valid and totally filled. If information like customer name, address, password somehow failed to fullfill then the test process will be in fail process. If not then it will pass to the login phase. If then customer will avail to go to the login. For unsuccessful registration the page will remain in the registration phase again and the customer will be notified by a sms. So pass criteria would be that all the field for registration will be properly filled and then accepting all fields customer will be notified by a customized text.

11.6. test entry and exit criteria

User registration will start or entry after confirming the customer that all data has been entered. Tester will check one by one if the password and information is right then the cycle will continue for entry. Afterhand if the information is wrong then the system will be exit from the testing. After that if the information will match with acceptance criteria then it will go for log in pages.

11.7 Test Deliverables:

Prior to deliver the system or registration feature developers and as well testers test this feature again with customers requirements. After rechecking all documents they pass it to project managers will features screen shots, diagram and reports with its actual result of all approval significant things.

11.8 Test Suspension / Resumption criteria:

For registration of customer there have suspension criteria if any feature will be not added that find during the testing phase. Other wise if any feature like adding optional phone number is not taking that kinds of feature must have to solve and retest by testers and create by developers. Whenever it full fill all requirement and approved by all participant it will be pass from test suspension.

11.5 Test Environmental / Staffing / Training needs

Forecasting a developer and testers have friendly environment with faster network controller, 1 DAP workstation, 6 network PC's, 1 HP LaserJet 4v Printer as well as 1 Oracle server. Those specifications are important because currently user use different branches of window and they expect excellent outcome.

Item to test	Test description	date	
Customer login	<p>specified login id and password will be determined by the system. If the id and password matched then there will be a successful login and then it will go to menu page.</p> <p>If it failed then there will be a message that the id or password not matched.</p>	22-06-24	Developer
